

PRYZM

DEVELOPMENT. COMPUTED.

From real parcel to computable building

Cloud-native BIM authoring + development intelligence

2 THE PROBLEM

A building still lives in disconnected systems.

The industry has models of the building, models of the site, models of the rules and models of the economics — but not one model that understands their relationships.

From Site Intelligence to a Living Building Model.

One connected, computable model linking the real world, rules, architecture, analytics and investment decisions.

Start with a real parcel.

Select a real parcel and combine cadastral, geospatial and planning information to establish the development constraints before design begins.

1. SELECT Real parcel

2. UNDERSTAND Site + GIS + planning

3. COMPUTE Buildable envelope

Before designing the building, Pryzm computes the design space.

A computable design space — not a static polygon.

Cadastral boundary

Planning Context

Buildable Envelope

Pryzm is an authoring system, not a BIM viewer.

Then author the building – directly in the browser.

A cloud-native BIM authoring environment.

Design, modify and coordinate structured building elements directly in the browser — without reducing BIM to a viewer.

The model understand relationships

Pryzm doesn't treat a building as a collection of objects. It understands how spaces, geometry, rules and data relate, so changes can propagate through the model.

One Change. Every Consequence.

Change one element and every connected part of the building responds.

Don't prompt for an image. Prompt the building.

The industry has models of the building, models of the site, models of the rules and models of the economics — but not one model that understands their relationships.

Every Decision Remains Connected.

Pryzm continuously connects geometry, rules, quantities and development metrics, so when the design changes, its consequences are immediately recalculated.

Every decision remains connected.

Before designing the building, Pryzm computes the design space.

A computable design space — not a static polygon.

Documentation: Plans, Elevations, Sections

3d Model

Deliverables

Every decision remains connected.

One connected, computable model linking the real world, rules, architecture, analytics and investment decisions.

FEASIBILITY
Cost + revenue
+ value

SITE
Parcel + GIS + regulations

DEVELOPMENT
Envelope +
massing

ANALYTICS
GFA + units +
efficiency +
compliance

ARCHITECTURE
Floors + apartments
+ rooms

Describe the development Pryzm builds it.

Define the site, objectives and constraints in natural language or parameters. Pryzm generates a structured development that can be analysed, modified and recomputed.

01 — DEFINE INTENT

SITE
Parcel + GIS + context
RULES
Planning + constraints
OBJECTIVES
Area + units + efficiency + mix

02 — COMPUTE

03 — GENERATE

Ask the Model. Explore the Development.

One connected, computable model linking the real world, rules, architecture, analytics and investment decisions.

A New Computational Foundation for the Built Environment.

Pryzm is built around a live, structured representation of development — designed for computation, automation and machine reasoning rather than simply documentation.

Compress the Development Cycle.

Pryzm turns development from a sequence of handoffs into a continuous loop of generate, evaluate, adapt and decide.

1 THE VISION

Compute every development decision

Pryzm is a **computational platform** for **real-estate development**, connecting **land, regulations, architecture, analysis** and **value** in one living model.
